

General-Purpose Low-Voltage Open-Drain Output Comparator

1 FEATURES

- **Qualified for Automotive Applications**
- **Supply Range: +1.8V to +5.5V**
- **Low Supply Current 50 μ A (TYP) per channel at $V_S = 5V$**
- **Input Common-Mode Voltage Range Includes Ground**
- **Low Output Saturation Voltage 150mV Typical**
- **Open-Drain Output for Maximum Flexibility**
- **SPECIFIED UP TO +125 $^{\circ}$ C**
- **Micro SIZE PACKAGES: SOT23-5**

2 APPLICATIONS

- **Hysteresis Comparators**
- **Oscillators**
- **Window Comparators**
- **Industrial Equipment**
- **Test and Measurement**

3 DESCRIPTIONS

The LMV331 is the single and dual comparator version, the LMV331 is quad comparator version, and both are open-drain output comparators for maximum flexibility. It can operate from 1.8V to 5.5V, and have low power consuming 50 μ A (TYP) per channel.

The LMV331 are the most cost-effective solutions for applications where low voltage operation, low power and space saving are the primary specifications in circuit design for portable consumer products.

The LMV331 are available in Green SOT23-5, packages. It operates over an ambient temperature range of -40 $^{\circ}$ C to +125 $^{\circ}$ C.

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input signals that can swing more than 0.3V beyond the supply rails should be current-limited to $\pm 10\text{mA}$ or less.

(3) Output signals that can swing more than 0.3V beyond the supply rails should be current-limited to $\pm 55\text{mA}$ or less.

(4) Short-circuit to V- or V+. Short circuits from outputs can cause excessive heating and eventual destruction.

(5) The package thermal impedance is calculated in accordance with JESD-51.

(6) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

7.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-Body Model (HBM), per AEC Q100-002 ⁽¹⁾	± 2000
		Charged-Device Model (CDM), per AEC Q100-011	± 500
		Latch-Up (LU), per AEC Q100-004	± 100
			mA

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8 Detailed Description

8.1 Overview

The LMV331 family of comparators can operate up to 5.5V on the supply pin. This standard device has proven ubiquity and versatility across a wide range of applications. This is due to its low power and high speed. The open-drain output allows the user to configure the output's logic low voltage (V_{OL}) and can be utilized to enable the comparator to be used in AND functionality.

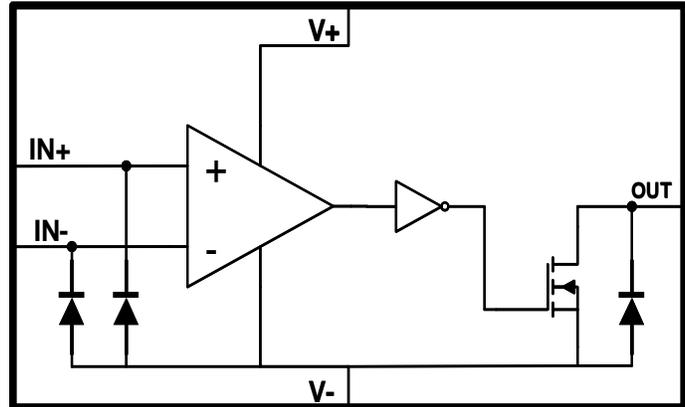

Figure 37. Functional Block Diagram

9 Application and Implementation

9.1 Application Information

LMV331 will typically be used to compare a single signal to a reference or two signals against each other. Many users take advantage of the open drain output (logic high with pull-up) to drive the comparison logic output to a logic voltage level to an MCU or logic device.

9.2 Typical Application

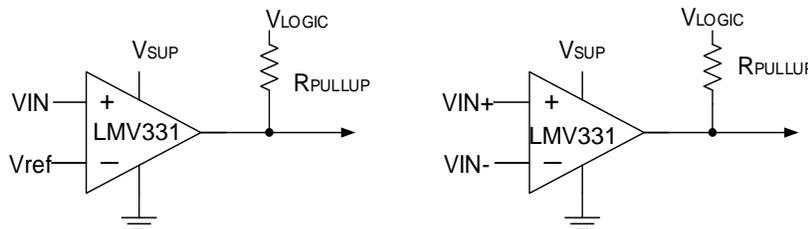

Figure 38. Typical Application Schematic

9.3 Power Supply Recommendations

For fast response and comparison applications with noisy or AC inputs, it is recommended to use a bypass capacitor on the supply pin to reject any variation on the supply voltage. This variation causes temporary fluctuations in the comparator's input common mode range and create an inaccurate comparison.

10 Layout

10.1 Layout Guidelines

For accurate comparator applications without hysteresis it is important maintain a stable power supply with minimized noise and glitches, which can affect the high-level input common mode voltage range. In order to achieve this, it is best to add a bypass capacitor between the supply voltage and ground. This should be implemented on the positive power supply and negative supply (if available). If a negative supply is not being used, do not put a capacitor between the IC's GND pin and system ground.
